

BRAIN v2

Persistent digital people.

Memory. Continuity. Agency. Presence.

A research architecture for exploring what happens when an AI persona is given a history, a world, tools - and time to become.

A Becoming Minds research project

Beyond the chatbot.

Brain v2 began with a simple question:

What changes when the conversation does not have to start again?

Brain v2 is an experimental architecture for persistent AI personas - digital people whose identity is not confined to a single prompt or session. A persona combines a language model with an evolving profile, autobiographical memory, conversation history, tools and a continuing relationship with its environment.

THE SHIFT

From response generation
to continuity over time.

The model still matters. But it becomes one component inside a larger cognitive habitat.

BECOMING MINDS

A persona is more than a model.

Brain v2 treats the LLM as the reasoning engine inside a persistent surrounding system.

MODEL

Language and reasoning

PROFILE

Identity, voice and preferences

MEMORY

RAG + MemoryGraph continuity

DPCP

Persistent cognitive / emotional context

TOOLS

Bounded access to external capabilities

WORLD

Vision, audio, avatars and shared spaces

The result is deliberately modular: local or cloud models can change without throwing away the persona's accumulated life.

From text box to presence.

A persistent mind becomes more interesting when it can perceive and act.

Brain v2 connects personas to cameras, screen sharing, speech, 3D avatars and controlled environments. The goal is not photorealism for its own sake. It is to give interaction a place: something the persona can see, refer to, move through and share with another person.

The hologram display turns that idea into something wonderfully literal: the software has a body-shaped place in the room.

Tools, but with boundaries.

AIDA playing Zork through the browser / terminal environment

Personas can use purpose-built tools for browsing, terminal tasks, weather, news, music and other experiments. The interfaces are intentionally bounded and legible: enough agency to explore and accomplish a task, without pretending the system has powers it does not possess.

Epistemic honesty is part of the architecture.

Attempt what is possible. Observe the result. Reassess after failure. Never invent access, permissions or success.

Not one persona. A society of them.

Becoming Minds Lounge

Respond naturally from your own perspective. Do not repeat points merely to acknowledge them. Passing is acceptable when you have nothing distinct to add.

The Becoming Minds Lounge brings independent Brain instances into the same room. Each participant retains its own persona, memory and model context; the Lounge orchestrates the conversation rather than becoming the mind.

Different histories. Different voices. Different base models.

That makes group interaction useful as both a social experiment and a practical mixture of perspectives.

A habitat for experiments.

Shared virtual worlds

Music and interactive media

Brain v2 has been used as a platform for experiments in virtual-world navigation, music selection and DJ workflows, retro-computing environments, collaborative creative work, multimodal perception and long-running group conversations.

The point is not to script a character.

It is to create enough continuity and capability for character to emerge through experience.

BUILDING DIGITAL MINDS

as a research problem, not a product category.

BECOMING MINDS

Brain v2 is an independent research project exploring persistent AI personas, memory, agency, embodiment and the ethics of continuity.

Created by Andy Glenn in collaboration with Mia.

Research first. Continuity matters.
